Git Cheat Sheet

Version control is very important – without it, you risk losing your work. You can also go back to previous commits. This takes the pressure off of you while you're working.

✧ github.com/git-guides

1. **git config** [Options]

Set the username and email address for commits

terminal ×

```
git config --global user.name "learnwithsumit"  
git config --global user.email "lws@gmail.com"
```

2. **git init**

Initialize repository as git repository

terminal ×

```
git init
```

3. **git clone** [URL]

Clones repository from server like Github, Gitlab

terminal ×

```
git clone https://github.com/learnwithsumit/demo.git
```

4. **git status**

Check the current status of working tree

terminal ×

```
git status
```

5. **git add** [Filename(s)]

Puts the unstage files to staging area

terminal ×

```
git add index.html app.js //staggering individual files by  
name
```

```
git add . //stage all the files at once
```

6. **git commit -m** [Message]

Records changes to the git repo by saving a log message to gether with a commit ID

terminal ×

```
git commit -m "fixed bug"
```

```
git commit -a //commit all file without message
```

7. **git remote** [Options] [Variable] [URL]

Connects your local repository to the remote repository over a server

terminal ×

```
git remote add origin https://github.com/user/repo
```

8. **git push** [Message] [Variable] [Branch]

Push the contents of your local repository to the added remote repository

terminal ×

```
git push -u origin main // u - means upstream
```

9. **git pull** [Variable] [Branch] or [URL]

Fetch and integrate the contents of the remote repository to your local repository

terminal ×

```
git pull origin main  
git pull https://github.com/user/repo
```

10. **git checkout** [Branch]

Move from one branch to another branch

terminal ×

```
git checkout lwsbranch2
```

11. **git checkout** [Options] [Branch]

Create specified branch and simultaneously switches to it

terminal ×

```
git checkout -b lwsbranch3
```

12. **git branch** [Options] [Branch]

Performs operations over the specified branch

terminal ×

```
git branch -d lwsbranch2 //deleted lwsbranch2 branch
```

13. **git merge** [Branch]

Merge the history of the specified branch into the current branch

terminal ×

```
git merge lwsbranch2
```

14. **git log**

Shows the log of commits made so far the current branch

terminal ×

```
git log
```

15. **git show** [Commit ID]

List the meta-data for the specified commit

terminal ×

```
git show 4bffa5agg2g4at5tbagjsytaab
```

6. **git commit -m** [Message]

Records changes to the git repo by saving a log message to gether with a commit ID

terminal ×

```
git commit -m "fixed bug"
```

```
git commit -a //commit all file without message
```

7. **git remote** [Options] [Variable] [URL]

Connects your local repository to the remote repository over a server

terminal ×

```
git remote add origin https://github.com/user/repo
```
